

Abstract

The invention concerns a decorative device consisting of a support layer having some flexibility, on one surface of which are set and fixed, along predefined zones, plant or mineral materials of selected colours, which produce a predetermined pattern. Said materials can be set using a moulding template, provided with orifices corresponding to said zones. Some raised parts left free on the support layer, advantageously surround the various coloured areas. The inventive device is useful for urban and landscape arrangement, as well as for decoration for special events.
